Phone: 305-3542

barba.koroma@uspto.gov

### Search Notes

Examiner Mitchell,

Please find attached results of the search you requested. The titles of hits are initially listed for quick perusal, followed by a detailed printout. The search involved searching structures along with the CAS numbers of various compounds in the composition, within the REGISTRY file. The hits were then crossed into CAPLUS and combined with each other and with utility text terms (i.e. cement or concrete composition). Please note that no hits were generated when the compounds in claim 1a were "anded." Please let me know if you have any questions.

Thanks.

<p>AB The polymer powders comprise polymer particles prepd. from ethylenically unsatd. monomers and/or diene monomers covered with anionic group-contg. vinyl alc. polymers satisfying <math>(-0.025 \text{ times. SV} + 2.40) &lt; I_a</math> (SV = sapon. degree; <math>I_a</math> = absorbance at 490 nm when mixed with I soln.). Thus, polymn. of Me methacrylate and Bu acrylate in the presence of sapon. allylsulfonic acid-vinyl acetate copolymer sodium salt (SV 83.0 mol%, <math>I_a</math> 0.330) gave a copolymer emulsion, which was spray-dried to give powders with good blocking resistance, film-formability, and water resistance. A compn. contg. cement and the powders was cured to give a test piece showing bending strength (JIS A 6203) 69 kg/cm<sup>2</sup>, compressive strength 300 kg/cm<sup>2</sup>, and good impact resistance.</p>

AB Cement dispersants comprise copolymers from monomers including .alpha., .beta.-unsatd. carboxylic acids or their alkali salts and (meth)acrylamide having alkylene oxide side chains. The dispersants (e.g., acrylic acid-polyethylene glycol N-methylolacrylamide monoether copolymer) prevent slump loss of cement compns. and show good water-reducing ability.

AB The compns. comprise 1st pastes contg. .alpha.,.beta.-unsatd. carboxylic acid polymers, H2O, and fillers inert to the polymers and 2nd pastes contg. fluoroaluminosilicate glass powders and acid group-free monomers. The 1st and/or 2nd pastes contain polymn. catalysts. The pastes give cured products of uniform property by simple mixing. First paste contg. acrylic acid-maleic acid copolymer 42, H2O 42, silane-treated siliceous sand powder 11, and Na benzenesulfinate 5 wt.% and 2nd paste contg. silane-treated fluoroaluminosilicate glass powder 73, hydroxyethyl methacrylate 15, 2-hydroxy-1-acryloyloxy-3-methacryloyloxypropane 4, di-2-methacryloyloxyethyl 2,2,4-triethylhexamethylenedicarbamate 4, and glycidyl methacrylate 4 wt.% were mixed to give a cured product showing bending strength 71 MPa and compressive strength 166 MPa. The processable time of the paste was 2 min 25 s.

AB The cement paste compns. contain slag-type inorg. powder having av. particle size 0.1-10 .mu.m and a polymer emulsion having av. particle size 30-200 nm, which is prepd. by emulsion polymg. monomer mixts. contg. (1) unsatd. monomer selected from unsatd. monomer having carboxylic group and/or sulfo group and unsatd. monomer from carboxylic acid salt and/or sulfonate and (2) (meth)acrylic acid ester. The polymer emulsion improves the fluidity, prevents cracking, and enhances strength.

AB The hydraulic compns. comprise a hydraulic material, water, and an additive comprising a crosslinked polymer in which, between main chains having water-sol. polymer structure of wt.-av. mol. wt. 500-100,000, a bond having as a structural unit .gtoreq.1 divalent groups having general formula  $R_1CO_2R_2$  [independently,  $R_1$ ,  $R_2$  is selected from  $CH_2$ ,  $CH(R)$  p-Ph,  $CR(R_1)$ , and  $CH_2CH(OH)$ , with the proviso that  $R_1$  is not required if  $R_2$  is  $CH_2CH(OH)$  (independently,  $R$ ,  $R_1$  = C1-5-alkyl)], and in which the main chains comprise .gtoreq.1 members selected from  $CO_2M$ ,  $CO_2(R_{50})mSO_3M$ ,  $CONHR_7SO_3M$ ,  $(CH_2)_nSO_3M$ , and p-Ph- $SO_3M$  ( $m$  = 0 or integral no. of 1-50;  $n$  = 0 or 1;  $M$  is .gtoreq.1 selected from H, mono-, di-, or trivalent metal,  $NH_4$ , and org. amine; independently,  $R_1$ ,  $R_6$  = C2-4-alkylene;  $R_7$  = C1-5-alkylene; with the proviso that when  $m$  .gtoreq.2, many of  $R_{50}$  may be the same or different, and, when many of  $R_{50}$  are different from one another, their arrangement may be regular or irregular), and in which the crosslinked polymer is capable of forming a water-sol. polymer by cleavage of the divalent group in an alk. medium. The additive are prepd. by obtaining a crosslinked polymer by a polymg. a monomer contg. .gtoreq.2

polymerizable double bonds and has as structural unit .gtoreq.1 divalent groups as above, with a monomer having one polymerizable double bond capable of copolymg. with the double bonds and capable to form a main chain structure capable of leading to a water-sol. polymer as above. Into a reactor, contg. N-stirred boiling water 164.2 were introduced a soln. contg. NK-ester M-9G (methoxypolyethylene glycol monomethacrylate; av. added ethylene oxide mole no. is 9) 62.9, methacrylic acid 16.7, and water 125.5, and, in addn., 2.5% aq. (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> soln. 24.6 wt. parts over 4 h. Then, 6.1 wt. parts 2.5% aq. (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> soln. were added over 1 h, and the mixt. was maintained at the b.p. for 1 h to complete the polymn. reaction, whereby a water-sol. polymer was obtained. To this polymer were added 3.2 wt. parts Denacol EX-721 (o-phthalic acid diglycidyl ester) and the mixt. maintained at the b.p. for 3 h, and neutralized with aq. NaOH to obtain a hydrophilic resin. A concrete mix contg. portland cement 320, water 173, fine aggregate (sand) 934, and coarse aggregate (crushed stone) 876 kg/m<sup>3</sup>, and 0.12 wt.% hydrophilic resin as above had initial, and 60-, 90, and 120-min slump an air content 17.7 and 4.9, 19.3 and 5.2, 18.5 and 5.1, and 17.8 cm and 4.8%, and 28-day condensation strength 352 kg/cm<sup>2</sup> and begining and ending setting time 5:25 and 7 h and 18 min, vs. 18.2 and 4.8, 16.8 and 4.9, 14.2 and 4.6, and 10.4 and 4.2, and 338 and 5:24 and 7:19, resp.

AB The admixt. comprise a copolymer comprising, as structural units, units derived from an ethylenically unsatd. monomer (a) contg. 25-300 mols C2-3-oxyalkylene groups, and units derived from a monomer (b) of an alkyl, alkenyl or hydroxyalkyl ester of an ethylenically unsatd. mono- or dicarboxylic acid. The admixts. are effective in imparting fluidity to hydraulic **compns.**, e.g., **cement** pastes, mortar, and **concrete**, esp. in maintaining fluidity of the **compns.**, and hardly retard hardening of the **compns.** A **cement compn.** contg. 0.27% methoxypolyethylene glycol methacrylate-Me acrylate copolymer telomer with 2-mercaptoethanol gave slump after 120 min 22.5 cm and initial and final setting time 4 h 52 min and 6 h 31 min, vs. 7.0 cm, and 7 h 20 min and 8 h 58 min for a control.

GI

AB Ring-contg. polymers I [X = CH<sub>2</sub>, O; AB = CHCH, C:C; U = CO<sub>2</sub>H, CO<sub>2</sub>R<sub>3</sub>, YP; Y = CH<sub>2</sub>O, C(O)O, C(O)OR<sub>1</sub>O; P = CH<sub>2</sub>:CHC(O), CH<sub>2</sub>:CMeC(O), CH<sub>2</sub>:CHCH<sub>2</sub>, CH<sub>2</sub>:CHC<sub>6</sub>H<sub>4</sub>CH<sub>2</sub>; V = H, CO<sub>2</sub>H, CH<sub>2</sub>OH, R<sub>3</sub>, OR<sub>2</sub>, C(O)OR<sub>2</sub>; or UV = C(O)TC(O); T = O, NH, NR<sub>3</sub>; R<sub>1</sub> = (substituted) C1-5 alkylene or oxyalkylene; R<sub>2</sub> = (substituted) C1-12 alkyl; R<sub>3</sub> = R<sub>2</sub>, C<sub>6</sub>-14 aryl], prepd. by ring-opening radical polymn. of unsatd. bicyclo[2.2.1] compds. at room temp., adhere strongly to a variety of substrates, form **cements** when combined with reactive fillers, and are useful as components of coatings, **cements**, adhesives, and **composites** esp. for dental use.

Thus, 5-norbornene-2,3-endo/exo-dicarboxylic acid underwent addn. to 3,4-dihydro-2H-pyran in the presence of pyridinium tosylate to form bis(tetrahydropyran-2-yl) 5-norbornene-2,3-endo/exo-dicarboxylate (II). II underwent metathetic ring-opening polymn. with 5-norbornene-2-endo/exo-Me methacrylate (prepn. given) in the presence of catalytic amts. of the Mo carbene complex III (prepn. given), followed by cleavage of the tetrahydropyranyl groups with p-toluenesulfonic acid, to form a copolymer of I (X = CH<sub>2</sub>, AB = CHCH, U = V = CO<sub>2</sub>H) and I (X = CH<sub>2</sub>, AB = CHCH, U = CH<sub>2</sub>:CMeC(O)OCH<sub>2</sub>, V = H). A dental adhesive contg. this copolymer 18.0, deionized water 32.4, 2-hydroxyethyl methacrylate 44.2, maleic acid 3.0, camphorquinone 0.3, hydroquinone mono-Me ether 0.1, NH<sub>4</sub>F 1.0, and diphenyliodonium hexafluorophosphate 1.0 wt.% was applied to the dentin surface of extd. teeth, photopolymd., and coated with a com. filling **composite** (Compoglass) which was also photopolymd. The shear strength of the resulting **composite** structure was 15.6 MPa.

AB The process comprises coating the mineral products with an aq. dispersion of a polymer, in radically polycond. form, contg.  $\geq 1$  ethylenically unsatd. acids and/or their conjugated bases having general formula  $\text{CH}_2:\text{C}(\text{R}_1)\text{C}(\text{O})\text{XC}(\text{R}_2)(\text{R}_3)(\text{CH}_2)_n\text{SO}_3\text{-Y}^+(\text{I})$  [ $n = 0-2$ ; independently,  $\text{R}_1-3 = \text{H}$  or  $\text{Me}$ ;  $\text{X} = \text{H}$  or imino group ( $\text{NH}$ );  $\text{Y} = \text{H}$ , alkali metal, or  $\text{NH}_4$ ]. The aq. dispersions are manufd. by (1) providing a mixt. contg. 10-50 wt. of the total amt. of water to be used, 0-50 wt.% of the total amt. of dispersant to be used, and at least part of the monomers of type I, heating the mixt. to polymn. temp., (2) providing an emulsion contg. the balance of the monomers of type I, the balance of the other monomers, the balance of the dispersant, and 10-50 wt.% of the water to be used, (3) providing a soln. of the polymn. initiator in 10-20 wt.% of the water to be used, adding 1-10 wt.% (each) of the emulsion and the soln. to the heated mixt. and polymg.  $\geq 80\%$  of the monomers present, and adding the balance of the emulsion and the soln. Films obtained with the aq. polymer dispersions have glass transition temp.  $> 20$  to  $50^\circ\text{C}$ . and contain 90-95 wt.% of  $\geq 1$  monomers comprising esters of acrylic acid and methacrylic acid with  $\text{C}_{1-8}$ -alcs., styrene,  $\alpha$ -methylstyrene, o-chlorostyrene, and vinyltoluene, 0.5-5 wt.% of  $\geq 1$  monomers comprising acrylic acid, methacrylic acid, itaconic acid, their alkali metal and  $\text{NH}_4$  salts, acrylamide, and methacrylamide, and 0.5-5 wt.% of  $\geq 1$  monomers of type I. Extruded green concrete (sand-cement-water) products spray coated with the emulsions (polymer content 40, antifoaming agent content 5 wt.%) to  $120 \text{ g/m}^2$ , dried in a climate chamber at relative humidity 50% did not show any efflorescence.

AB Title materials with good flowability and processability, useful for gap-filling of cables, comprise (a) acrylic micropolymer emulsions with av. particle size 30-200 nm prepd. by emulsion polymn. of .gtoreq.1 unsatd. monomers having carboxylic acid (salts) and/or sulfonic acid (salts) and (meth)acrylic acid esters and (b) water-curable compns. Thus, portland cement and acrylic emulsion comprising core prepd. from Bu acrylate (I) 79.0, Me methacrylate (II) 20.0, and trimethylolpropane methacrylate (III) 1.0 parts and shell prepd. from I 18.5, methacrylic acid 3.0, II 73.0, III 1.8, 2-acrylamide-2-methylpropanesulfonic acid 1.8, and N-methylolacrylamide 1.8 parts were mixed to give a test piece showing good flowability and tensile strength 69 kg/cm<sup>2</sup>.

AB A setting retardant for a hydraulic cement compn. comprises a polymer formed from two or three different monomers. The 1st monomer is a compd. of formula (R1)R2C:CR3(R4) wherein R1 is a H or CH3; R2 is H or COOH; R3 is H or COOH; and R4 is H, COOH or CH2COOH; provided that when R1 is H and R2 is COOH, R3 and R4 are different and are either H or COOH; when R1 and R2 are both H, R3 is COOH and R4 is CH2COOH; and when R1 is CH3, R2 is COOH and R3 and R4 are different and are either H or COOH; the 2nd monomer-forming compd. is 2-acrylamido-2-methylpropane sulfonic acid, sodium methyl sulfonate, sodium p-vinyl benzene sulfonate, acrylamide, N,N-dimethylacrylamide, vinyl sulfonic acid, acrylonitrile, 1-vinyl-2-pyrrolidone, vinyl phosphonic acid, diallyldimethylammonium chloride, diethylaminoethyl methacrylate, dimethylaminoethyl acrylate Me chloride, methacrylamido propyltrimethyl ammonium chloride, N,N-dimethylaminoethyl methacrylate, or 2-triethylammoniummethyl methacrylate chloride; and the 3rd monomer-forming compds.

AB The injection agents contain acrylic polymers with intrinsic viscosity (.eta.) 0.1-2.0 dL/g and optionally org. dispersing agents and are blended as builders with inorg. soil-stabilizing agents and injected into ground. Thus, an aq. mixt. of cement 450, bentonite 50, and polymethacrylamide (.eta. 0.55) 0.9 part showed bleeding (JSCE-1986) 2.0% after 20 h and viscosity (JSCE-1986) 10.0 s initially, 11.2 after 1 h, and 16.6 after 2 h.

PRIORITY APPLN. INFO.: JP 1990-24137 19900201

AB The admixts. are 95/5-40/60 mol copolymers of CH<sub>2</sub>:CR<sub>1</sub>CONHR<sub>2</sub>SO<sub>3</sub>X [R<sub>1</sub> = H, lower alkyl; R<sub>2</sub> = C<sub>1</sub>-4 linear or branched alkyl; X = H, alkali metal, alk. earth metal, (org.) ammonium] with unsatd. carboxylic acid ester or vinyl acetate. The admixts. give **cement compns.** having high fluidity and low slump loss, without setting delaying. **Concrete** contg. Me methacrylate-Na 2-acrylamide-2-methylpropanesulfonate had lasting slump and air content without retarding.
